### **Adaptive Control of Guided Missiles**

As opposed to the LOS system, this guidance system involves only two players: the missile and the target. This system also has two variants, namely Altitude Pursuit (AP) and Velocity Pursuit (VP). In AP, the axis of the missile is kept pointing towards the target, whereas in VP, the velocity vector of the missile is kept pointing at the target. These two axes, i.e. the axis of the missile and its angle of attack, are usually not the same, as the missile sometimes skids as it flies through ...

Missile guidance refers to a variety of methods of guiding a missile or a guided bomb to its intended target. The missile's target accuracy is a critical factor for its effectiveness. Guidance systems improve missile accuracy by improving its Probability of Guidance. These guidance technologies can generally be divided up into a number of categories, with the broadest categories being "active," "passive" and "preset" guidance. Missiles and guided bombs generally use similar types of guidance sys
