ADVANCED MUD GAS AND ROCK-FLUID Analysis Aids Evaluation of North American Unconventional Plays. RESERVOIR ISSUE 6 • JUNE 2013 21. (Continued on page 22...) Although unconventional oil and gas plays are highly variable in terms of

geology, geochemistry and structure, many of the key factors within these disciplines are repetitively quoted as influencing successful exploitation.

Gases monitored include hydrogen sulfide (H_2S) and carbon dioxide (CO_2). H_2S is poisonous, very corrosive when dissolved in water, and flammable as a gas. When dissolved in water (of the mud) it lowers the mud pH increasing corrosion tendencies. As a gas it is transported to the surface when air is applied as the drilling fluid.

Gas leaks, odor of gas, damaged lines, carbon monoxide symptoms and water main breaks are all considered emergencies. If you smell gas, do not attempt to locate the leak. Instead, leave the house or building right away. Do not use any electrical switches, appliances, lights, telephones, or mobile devices, as an electrical charge could create a ...

Gas Analysis - Halliburton

A simple method of evaluating mud/gas separation within the separator vessel has been developed as a basis for the sizing procedure. A mud/gas separator sizing worksheet will assist drilling personnel with the sizing calculations. The worksheet provides a quick and easy evaluation of most mud/gas separators for a specific well application.

Mud Logging Introduction • Mud logging is the creation of detailed reports of a borehole on a well site during active drilling • Liquid, or “mud”, is used as the drilling fluid to bring gas, formation fluids, and rock cuttings to the surface for analysis • A mud log provides key geographical information, including lithology,

The Mississippian Limestone Play in Kansas: Oil and Gas in ...

Marine lime mud and shelly debris from seas that repeatedly advanced and regressed resulted in the Mississippian limestone and chert layers found in the subsurface of south-central Kansas (Watney et al., 2002). In what is now a porous and fractured target zone of the Mississippian play, the limestone, but not the more durable chert, dissolved ...

into the mud system. Generally, the faster the ROP the higher the gas volumes and the lower the ROP the lower the gas volumes, yet better rock and geologic conditions can obviously yield better gas volumes. Therefore, particular gas curves (Std C1, C4, C6 and Benzene) are overlain on ROP (in FPH, feet/hour) to present relative activity.
