However, the C-terminus of the 3A protein (aa 77-153) has been shown to exhibit considerable variability in size and nucleotide sequence, while it plays critical role in the viral RNA synthesis in FBK cells . The highly genetic variability of 3A protein strongly suggests that this region may plays a very limited role for viral production.

The new human immunodeficiency retroviruses and old influenza viruses are only one among several examples of virus variation that prevent, or make very difficult, the production of reliable vaccines. It could be stated that the most important factor limiting the effectiveness of vaccines against virus infections is apparently virus variation.

Qalyub orthonairovirus, also known as Qalyub nairovirus or simply Qalyub virus, is a negative-sense single-stranded RNA virus discovered in a rat's nest in a tomb wall in the Egyptian town of Qalyub (Egyptian Arabic: **بوي لوق** pronounced [ʔæɫ'ju:b]) in 1952. The primary vector for transmission is the *Carios erraticus* tick, and thus it is an arbovirus.
