In a double replacement reaction, the more reactive metal "pushes" the other one out of its place. Where could you look to determine which metal was more reactive? Chemical Reactions:

Double Displacement Reaction Definition and Examples

A double replacement reaction is a type of chemical reaction that occurs when two reactants exchange cations or anions to yield two new products. Double replacement reactions are also called double displacement reactions, double displacement reactions, or metathesis reactions. Neutralization, precipitation, and gas formation are types of double replacement reactions.

Background: Double Replacement Reactions Are Among ...

ABSTRACT: In this lab double-replacement reactions were utilized to observe forming precipitates and to balance equations of newly formed solutions. Precipitates were found by combining a solution containing cations and anions to another solution of cations and anions. The double-replacement reactions were calculated using basic mathematic knowledge about balancing equations.
