Lebesgue Integral in his text Elements of Integration. Following Bartle's example, the paper opens with a discussion of the groundwork on which the theory of the Lebesgue Integral stands. As a house sits on cement and brick footings, the Lebesgue Integral is propped on solid mathematical concepts such as algebras and measures.

Lebesgue measure is both locally finite and inner regular, and so it is a Radon measure. Lebesgue measure is strictly positive on non-empty open sets, and so its support is the whole of \mathbb{R}^n . If A is a Lebesgue-measurable set with $\lambda(A) = 0$ (a null set), then every subset of A is also a null set. A fortiori, every subset of A is measurable.

Assuming almost no strong mathematical background, Bartle is able to build up the basic Lebesgue integral theory introducing the fundamental abstract concepts (sigma-algebra, measurable function, measure space, "almost everywhere", step function, etc.) in such an easy way that the student is not only able to handle them but to UNDERSTAND them.

1.40, p.18-19). We construct a measure for an infinitely often repeated random experiment with finitely many possible outcomes (Product measure, Bernoulli measure). Let S be the set of possible outcomes. For $s \in S$, let $p_s > 0$ be the probability that s occurs. Hence $\sum_{s \in S} p_s = 1$. For a fixed realization of the repeated experiment, let $z = (z_1, z_2, \dots)$

2 CHAPTER 4. LEBESGUE MEASURE AND INTEGRATION (iv) If $A = (a_1, a_2) \times (b_1, b_2) \times (c_1, c_2)$ is a rectangular box, then $\mu(A)$ is equal to the volume of A in the traditional sence, i.e. $\mu(A) = (a_2 - a_1)(b_2 - b_1)(c_2 - c_1)$ It turns out that it is impossible to measure the size of all subsets of A
