Skeletal system 1: the anatomy and physiology of bones ...

The Mechanostat is a term describing the way in which mechanical loading influences bone structure by changing the mass and architecture to provide a structure that resists habitual loads with an economical amount of material. As changes in the skeleton are accomplished by the processes of formation and resorption, the mechanostat models the effect of influences on the skeleton by those processes, through their effector cells, osteocytes, osteoblasts and osteoclasts. The term was invented by Har

Because the strength of bone tissue is related directly to mineral content, the stiffness and strength of an entire bone depends on the distribution and relative degree of mineralization of its osseous tissue. 26 The initial strength of new bone is the result of the cell-mediated process of primary mineralization, but its ultimate

strength is dictated by secondary mineralization, which is the physiochemical process of crystal growth. This concept has important clinical value in orthodontics.

Principles of Bone Biology - 3rd Edition

Bone (Osseous Tissue) Contains matrix of irregular materials surrounding widely separated cells. 25% water, 25% collagen fibers, 50% crystallized mineral salts. Calcification. As mineral salts are deposited in framework formed by collagen fibers, they crystallize and tissue hardens.

Support and movement. Bones are a site of attachment for ligaments and tendons, providing a skeletal framework that can produce movement through the coordinated use of levers, muscles, tendons and ligaments. The bones act as levers, while the muscles generate the forces responsible for moving the bones.
