A. Seed Function 1. propagation of plant 2. mechanism for offspring dispersal 3. protect immature plant in adverse conditions
B. Definitions • A fancy botanical definition for a seed: a ripened ovule • Steve's simplistic definition: a baby in a suitcase carrying its lunch

Seed Germination and Dormancy - Plant Cell

Germination: Seeds of various cultivated species are able to germinate a few days after ovule fertilization. In this case, germination refers to protrusion of the primary root, not the formation of a normal seedling because histo-differentiation has not been completed and reserve accumulation is still incipient at this phase.

INTRODUCTION Seeds are a vital component of the world's diet. Cereal grains alone, which comprise ~90% of all cultivated seeds, contribute up to half of the global per capita energy intake.

Oxygen is essential for seed germination. The initial phase of seed germination may involve anaerobic respiration but immediately it shifts to aerobic state. In a seed where testa is retained the oxygen consumption is much higher than in the seeds where testa has been removed.

Seed physiology and technology. Seed respiratory patterns during germination. As soon as they take up water, seeds begin to respire in order to generate the energy required to power germination. The Bradford lab has been testing the capabilities of an instrument, the Astec Q2, that can measure the respiratory patterns of individual seeds during germination.
